The Impact of Ethnic Diversity in Bureaucracies: Evidence from the Nigerian Civil Service

By Imran Rasul and Daniel Rogger

We document the correlation between the workplace diversity of bureaucracies and public services delivered. We do so in the context of the Federal Civil Service in Nigeria, the most important government bureaucracy operating in a highly ethnically fractionalized society in which ethnicity is a salient form of identity (Eifert, Miguel, and Posner 2010).

An established literature documents the potentially beneficial impacts of workplace diversity on organizational performance. Theoretically, diversity can positively impact on organizations by matching workers of a variety of perspectives or experiences, enhancing team creativity or problem solving capacities. Lazear (1999) and Hong and Page (2001), among others, develop models along these lines to make precise when workplace diversity beneficially impacts organizational performance. Shore et al. (2009) overview the evidence, much of which stems from private sector firms in high income settings, and consider diversity along age-race-gender lines. We provide novel evidence extending the empirical literature along all three margins: in the context of Nigeria, we document the relationship between public service delivery and the ethnic diversity of civil service organizations.

The impact of bureaucratic diversity on public service delivery in this context is not obvious. While the management literature suggests it might have positive impacts if it helps bureaucrats solve problems etc., an established macroeconomic literature documents a negative correlation between societal diversity and economy-wide outcomes. Beginning with Easterly and Levine (1997), a body of cross-jurisdiction evidence has suggested that more ethnically diverse societies have lower growth, choose worse policies, and are more likely to experience conflict (Alesina and La Ferrara 2005). Our analysis begins to shed light on whether the positive channels through which diversity operates, as stressed in the management literature (e.g., increased skill complementarity of workers in the production function), dominate the negative channels through which diversity might operate, as stressed in the macro literature (e.g., divisions in preferences, free-riding on other groups’ contributions, ineffective social sanctions, etc.).

Understanding the role of diversity in government bureaucracies is important because, as the state capacity literature has emphasized, the effective functioning of government bureaucracy matters for poverty, inequality, and economic growth (Besley and Persson 2010). In earlier work, Rasul and Rogger (2014)—henceforth, RR—documented how the management practices bureaucrats operate under correlate with public service delivery. We build on that analysis to examine the relevance of a key feature of Nigerian society: that it is highly ethnically fractionalized.

1 In Kenyan private sector settings, Hjort (2014) and Macchiavello and Morjaria (2014) show ethnic divisions impact productivity due to worker discrimination.
I. Data and Results

To study the link between public service delivery and ethnic diversity, we merge data on the outputs of government bureaucracies with a survey to bureaucrats. Both data sources are described in RR and here we just recap the core details.

On outputs, we use project level data for 4,700 projects implemented by 63 organizations in the Nigerian civil service, including government ministries and other federal agencies. We exploit data coded from the OPEN initiative in Nigeria, that traced, by project, the use and impact of 10 percent of all federal Government social sector expenditures approved in 2006–2007. Monitoring teams visited project sites 18 months after they were approved and recorded whether the project had started, and its stage of completion. Our outcome variable is a continuous zero to one measure of project completion rates. Projects are of 11 types, including construction (boreholes, buildings, etc.) and nonconstruction types (procurement, training, etc.).

We measure the ethnic diversity of bureaucrats through a survey fielded to a representative sample of 4,100 civil servants, corresponding to 13 percent of all bureaucrats in the 63 organizations we study. Civil servants were asked to name their ethnicity directly. Such self-reports have the advantage of measuring the identity most salient to the individual. However, such direct elicitations do not necessarily conform to a common dictionary. To convert responses to comparable ethnolinguistic groupings, we proceed in two steps. We first utilize Otite’s list. Second, to determine how ethnic groups relate to each other, we use Blench (2012) to build an ethnolinguistic tree: online Appendix Figure A1 represents the constructed family tree. Each individual’s ethnicity can thus be defined at three tiers: three families (Niger-Congo, Afro-Asiatic, Nilo-Saharan), 17 sub-families, and 51 sub-sub-families.

Table 1 describes how bureaucrats in the Nigerian civil service are distributed across families, sub-families, and sub-sub-families of ethnicities according to this ethnolinguistic tree. A substantial fraction of civil servants are from the Niger-Congo family of ethnicities, but are then split across 38 sub-families. Following the ethnic diversity literature, for each tier of ethnicity, we construct a standard measure of ethnolinguistic fractionalization in organization $n$, $ELF_n$, (one minus the Herfindahl index of ethnicities). This is interpreted as the probability that two randomly selected bureaucrats have different ethnicities, and so a higher $ELF_n$ measure implies a more diverse organization. We do so for each organization using these three tiers, as well as based on Otite’s (1990) list. As shown at the foot of Table 1, the average fractionalization of organizations is 0.19 if we use the highest tier of family ethnic groupings, 0.38 using the sub-family definition, 0.60 using the sub-sub-family definition, and 0.65 using Otite’s (1990) most disaggregated list.

Two points are of note. First, these latter two indices are very close in magnitude to Posner’s (2004) $ELF$ measure for Nigeria (0.66) that is based only on “politically relevant” ethnic groups. Second, the Nigerian bureaucracy appears far less diverse than the population, even using the most disaggregated ethnic groupings. For Nigeria as a whole, the $ELF$ is typically measured to be over 0.80 (Alesina and La Ferrara 2005).

The management literature stresses any beneficial impacts of workplace diversity on organizational performance likely operate through enhanced skill complementarity of workers. To probe this idea a little in our data, we examine whether there are significant differences across bureaucrats of different ethnicities, in their self-reported experiences on-the-job, beliefs about the job, and own motivation to originally join the Nigerian civil service.

On experiences, as part of the survey administered to bureaucrats, individuals were asked, “think about recent projects and/or programmes you worked on for this organization. In what proportion of the projects have you had to face the following difficult challenges?” Responses were ordered as Never (1), 1−25 percent (2), through to 75−100 percent (5). We then use an OLS model to regress these responses on bureaucrat characteristics and a set of ethnicity dummies, as defined at the sub-sub-family level. We then test whether the ethnicity dummies are jointly significant, conditional on these other individual
characteristics. We just highlight those areas of experience that significantly differ across ethnicities. For example, bureaucratic reports significantly differ by ethnicity relating to whether officials have been under pressure to divert funds (p-value on the joint F-test of ethnicity dummies is 0.01), or to change project specification (p-value 0.07).

Focusing next on bureaucrat beliefs, and again just highlighting a few areas where there are significant differences, we find that bureaucrats significantly differ by ethnicity on their belief that “officials should work within a team to achieve duties” (p-value 0.01), or their belief that it is “sometimes right to go around the strict rules of government” (p-value 0.05). Finally, we consider a proxy for civil servant’s intrinsic motivation: we asked bureaucrats which factor had most influenced them to originally enter the civil service. We define those that answered “the chance to serve Nigeria” as being intrinsically motivated. Around a third of officials give this answer, and we find this original motivation to join the civil service to differ significantly across ethnicities (p-value 0.02).

These dimensions provide suggestive evidence on how ethnic diversity might be beneficial for bureaucratic organizations, implying project completion rates might be higher in more ethnically diverse organizations if such bureaucracies bring together civil servants with divergent experiences, beliefs, and motivations.

Our empirical specification has as its unit of observation project i of type j in organization n. We estimate the following OLS specification,

Notes: The sample of civil servants described here are those who gave their ethnicity during the Civil Servants Survey, and their self-reported ethnicity could be located within the Otite (1990) categorization of ethnicities. This covers approximately 90 percent of all civil servants interviewed. The ethnolinguistic family structure relies on the coding of Blench (2012). We construct measures of ethnolinguistic fractionalization in organization n, for each level of aggregation of ethnicities (by family, sub-family, sub-sub-family, and based on Otite’s (1990) disaggregated groupings). This measure is one minus the Herfindahl index of ethnicities, and is interpreted as the probability that two randomly selected bureaucrats have different ethnicities. Hence, a higher ethnolinguistic fractionalization measure implies a more diverse organization.
where $y_{ijn}$ is the project completion rate and $ELF_n$ is the ethnolinguistic fractionalization in the organization,

$$y_{ijn} = \gamma_1 ELF_n + \beta_1 PC_{ijn} + \beta_2 OC_n + \lambda_j + \epsilon_{ijn},$$

$PC_{ijn}$ and $OC_n$ include project and organizational characteristics, respectively.\(^3\) As many organizations implement project type $j$, we control for project type fixed effects $\lambda_j$. Standard errors are clustered by project type-organization. To ease interpretation, $ELF_n$ is normalized into a $z$-score so that $\gamma_1$ is the effect size of diversity on project completion rates.

Table 2 presents our results and shows ethnic diversity in bureaucracies matters: a one standard deviation increase in the ethnolinguistic fractionalization of bureaucrats is associated with around 9 percent higher project completion rates. To put this in context, we note the average project completion rate is 46 percent, and 38 percent of projects have a zero completion rate. Hence, in line with evidence from the management literature based largely on private sector organizations operating in high income economies, here we also find the ethnic diversity of public sector organizations is positively correlated with their performance.\(^4\)

### II. Discussion

We contribute to the literature on the impact of workplace diversity on organizational performance. We do so in a public sector setting, considering organizations in the Federal Civil Service in Nigeria, a society in which ethnicity is the most salient dimension of diversity. Ethnic

\(^3\) $PC_{ijn}$ includes project complexity, log project budget, and whether the project is a rehabilitation or not. $OC_n$ includes the log number of staff, log total organization budget, log capital budget, the proportions of officials with a college and postgraduate degree. We also control for three dimensions of management practice in organizations considered in RR: the autonomy/flexibility given to bureaucrats in their daily task management; the provision of incentives/monitoring of bureaucrats; all other practices compiled into a third index. We also include “noise” controls related to the management interview.

\(^4\) On the extensive margin, we find comparable impacts of diversity on whether a project starts. The main results are robust to using a generalized linear model.
diversity in bureaucracies is found to be a force for good; more diverse organizations have significantly higher project completion rates.

The literature linking ethnic fragmentation and macroeconomic outcomes has emphasized that poor policy choices are a channel through which ethnic fragmentation lowers economic growth (La Porta et al. 1999). In this paper we have taken as given the set of projects the Nigerian bureaucracy is tasked to implement. Our focus has been, given this portfolio of projects, does the ethnic diversity of bureaucrats matter for the implementation of public projects? Clearly, future work should study the assignment of projects, and also whether the implementation of projects is impacted by the ethnic fractionalization among the communities being served by the project.

Finally, in contrast to diverse societies, in diverse organizations it might be much harder for certain groups to become segregated from others, and it becomes much easier for groups to be exposed to each other and thus potentially offset biases held against members of other groups. Both channels can be expected to improve performance, all else equal (Alesina and Zhuravskaya 2011). This suggests it is important to more closely study the processes by which bureaucrats are recruited into service, and the use of specific human resource strategies employed by bureaucracies in diverse societies, say related to assignments to teams and jobs, as well as job rotation, for the effective delivery of public services.
